# The Problem

To design an application in Java consisting of a client and a server where client will send set of coordinates and server will compute centroid using K means clustering algorithm we used our learning about the Software development Cycle from the Software Engineering Class back in undergraduate program.

Per Software development Cycle we divided our project in four phases:

- a) Planning
- b) Analysis
- c) Design
- d) Testing & Integration /Implementation

## **Planning**

We started our project by dividing it into small chunks as per their functions.

Below is the division at Client's end:

- a. Importing the data (coordinates) from the text file
- b. Converting the data from the text file into a byte array and then Transmitting it
- c. Receiving DACK , REQ functionalities and related timeouts
- d. Receiving CLUS , Sending CACK
- e. Converting the data from CLUS from byte to float.

Below is the division at Server's end:

- a. Receiving Data from client and sending DACK
- b. Converting the data from byte to float
- c. Receiving REQ, Implementing K means clustering
- d. Converting the data from float to byte.
- e. Sending CLUS and Receiving CACK

## **Analysis**

During analysis phase we wanted to make sure that we had complete knowledge about each functionality to be implemented at client's and server's end so that we don't get stuck in any phase while designing the code. In this phase we came up with few best practices to make our code more efficient. Below are some points on the same:

- a) While importing the data from text file we didn't wanted to overwhelm the client by reading and storing all the data in an Array at once. Hence, we decided to read, and

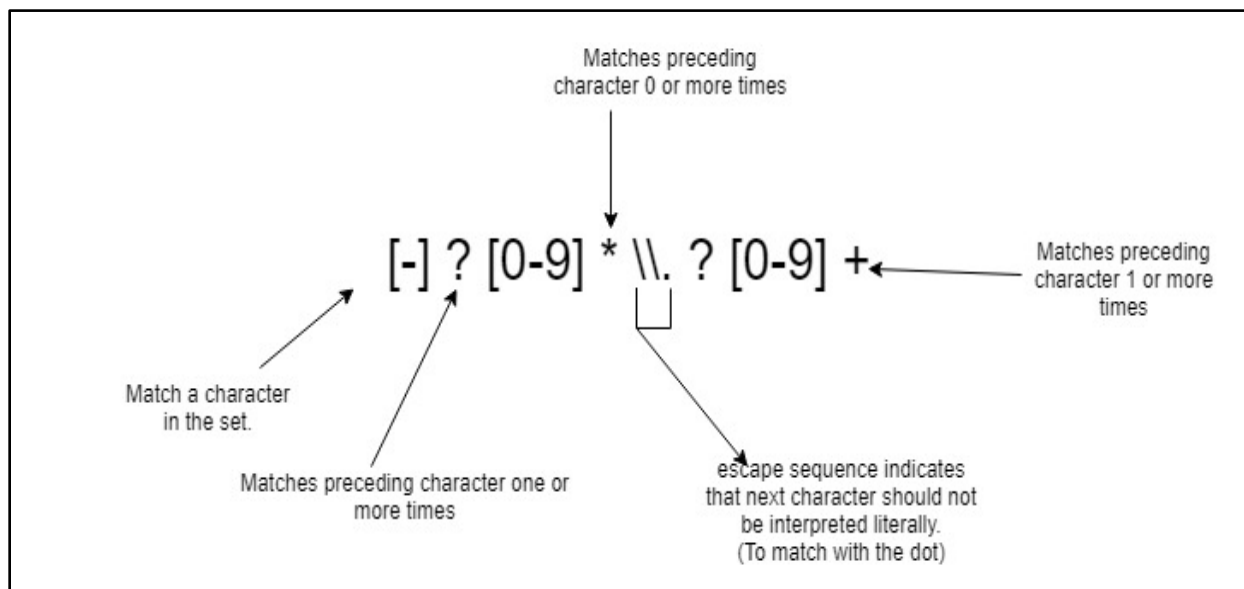

import let's say 10-50 number of lines at a time thereafter encoding it and sending it to server.

- b) Before writing the code, we drew block diagram for main functionality such as K-means clustering, byte encoding & decoding, importing data from text etc. to be implemented at client's and server's end and hence figured out the requirement of variables, loops, counters etc.
- c) At last we drew a timing diagram to understand the overall program flow and timers (timeout) functionality.

## Design

We divided the designing into two part. Firstly, we built the java program flow chart for each functionality and then translated the same into a code in eclipse.

Text file contained the data in a String format and the floating-point data couldn't be directly extracted using typecast. Hence, we used java.util.regex package (Matcher & Pattern class). Below is the regex expression that we have used to extract floating-point data from string.

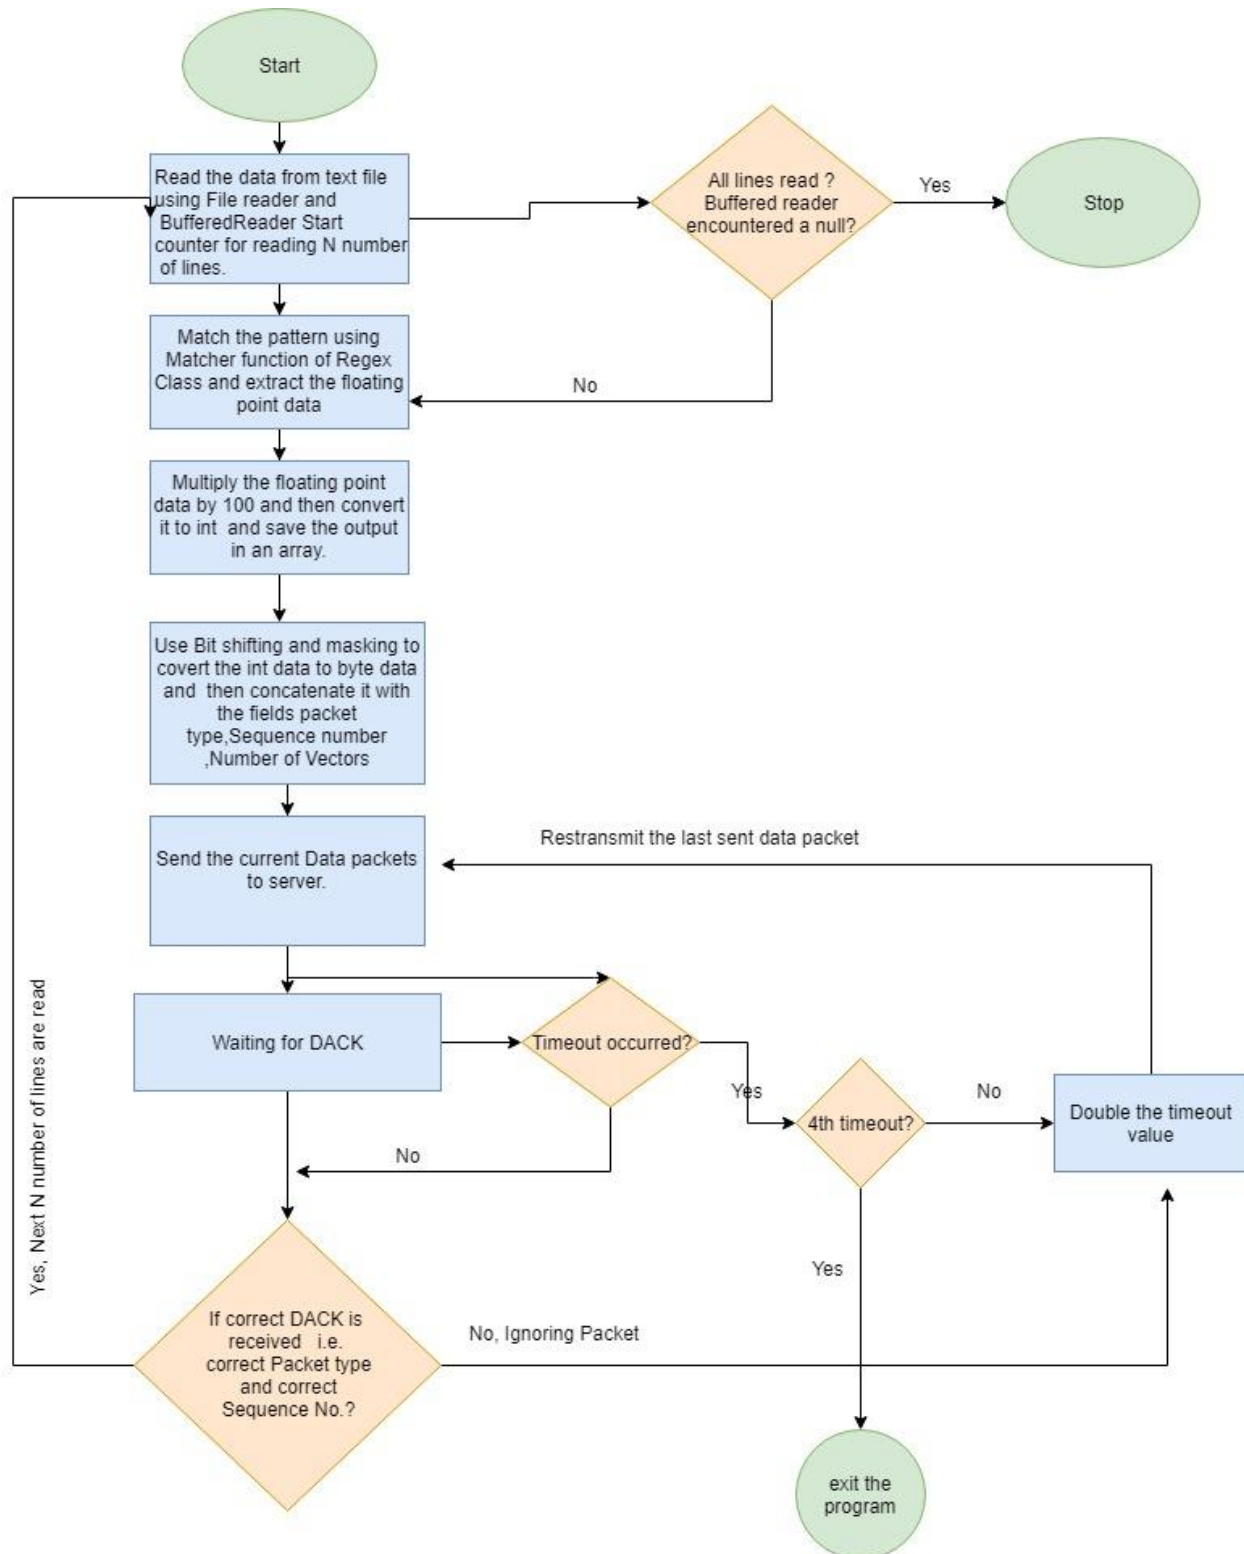

## Java program flow charts & Timing Diagram

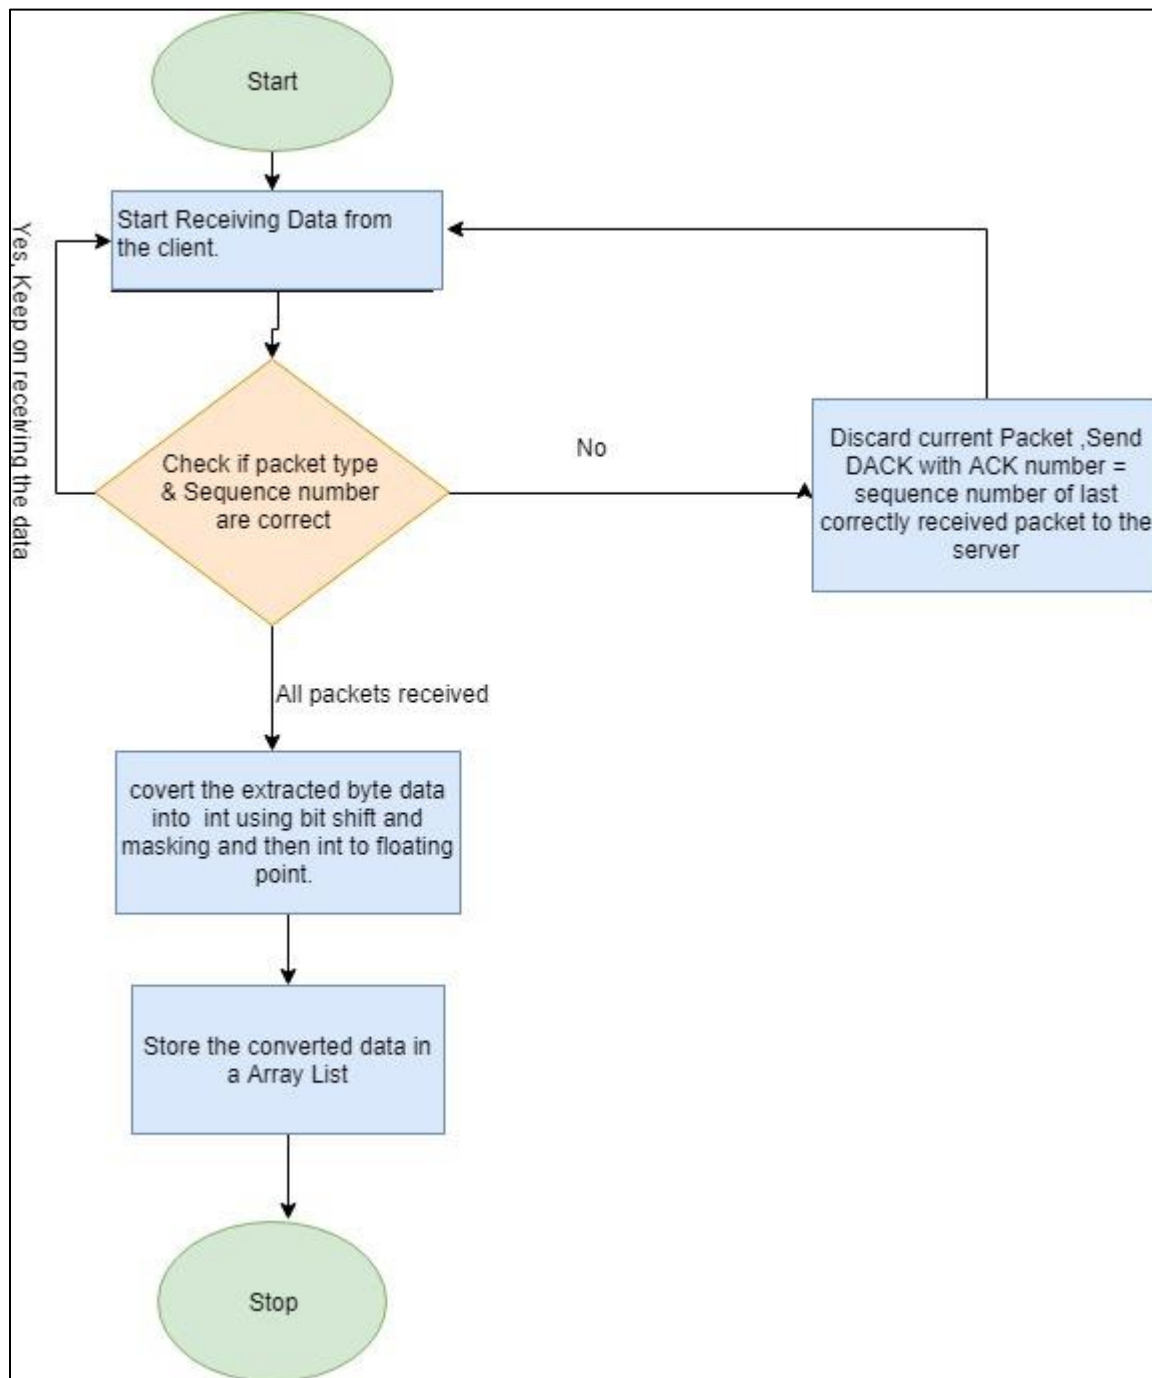

Before starting with the code in eclipse we drew following java program flow chart & Timing diagram to understand the program flow and functionality of each exchanges between client and server.

**Timing Diagram when everything goes well i.e. no packets are lost and correct packet are sent and received**

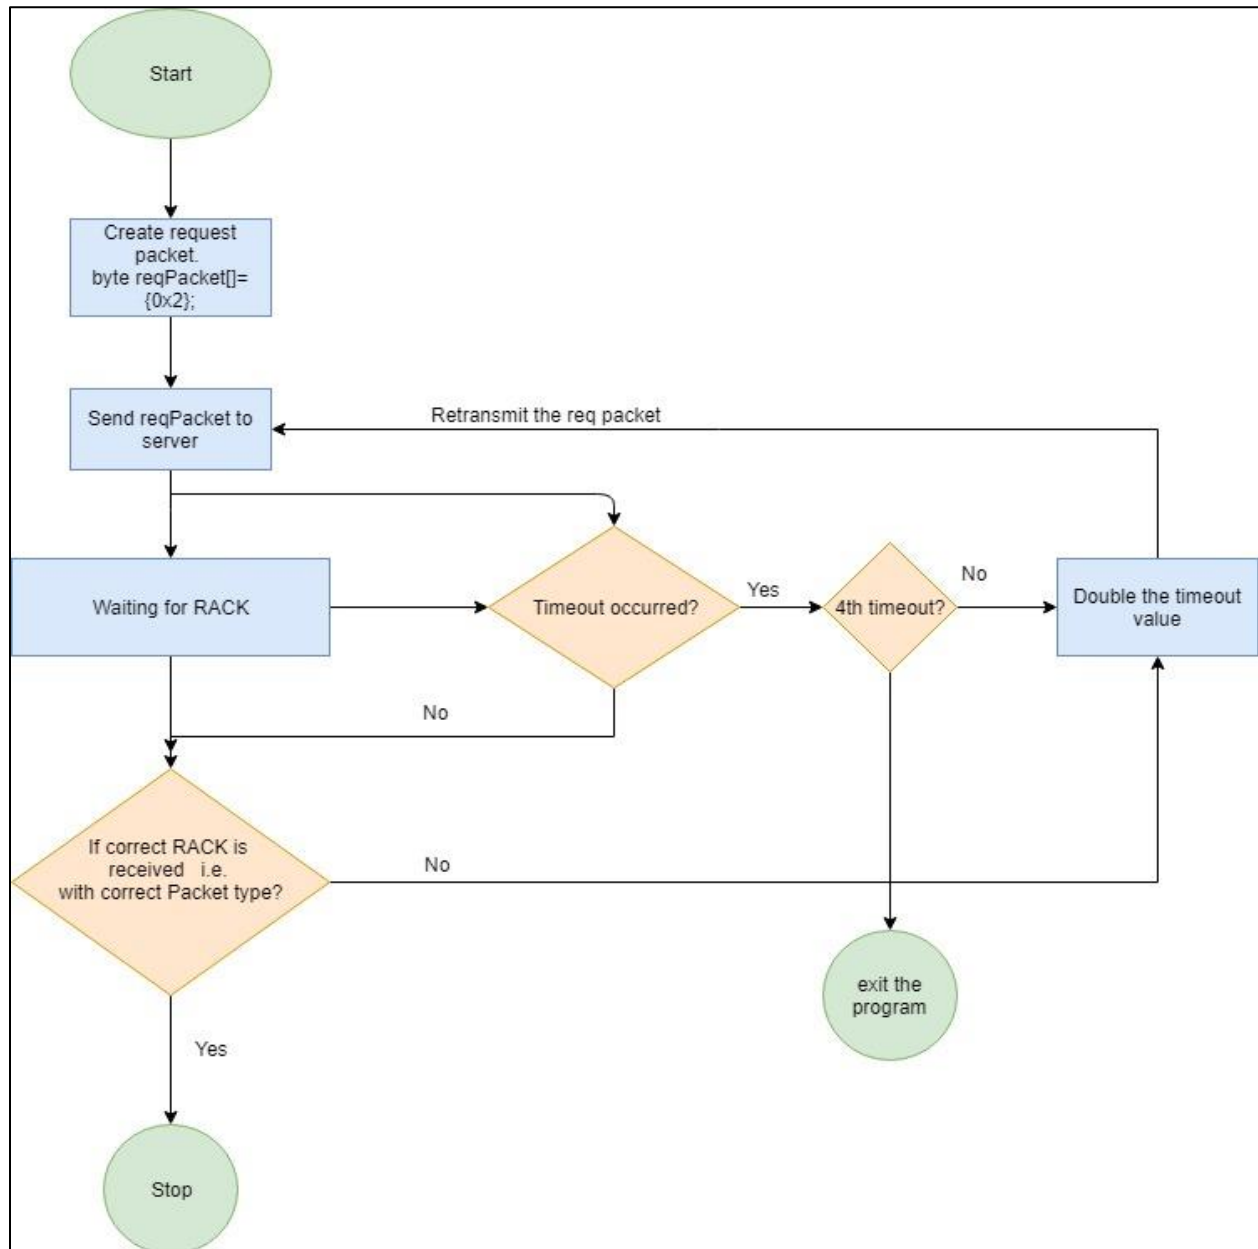

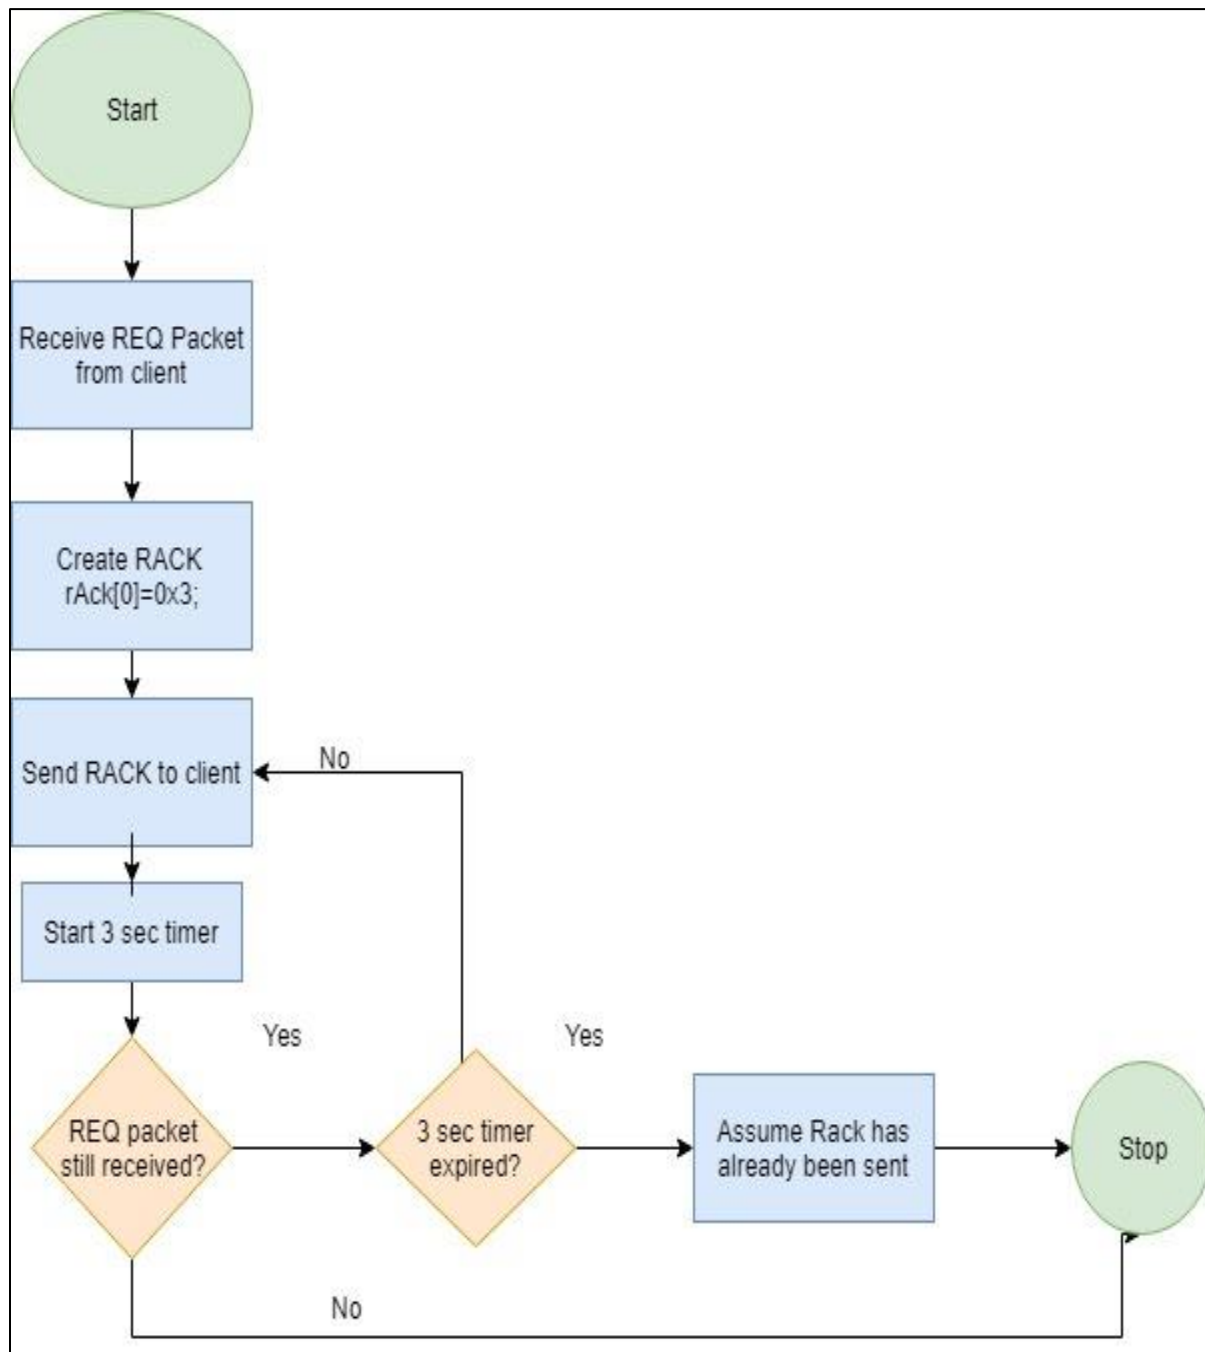

### Client Side: Reading data from text, Bye encoding, Sending Data Packets, Receiving DACK

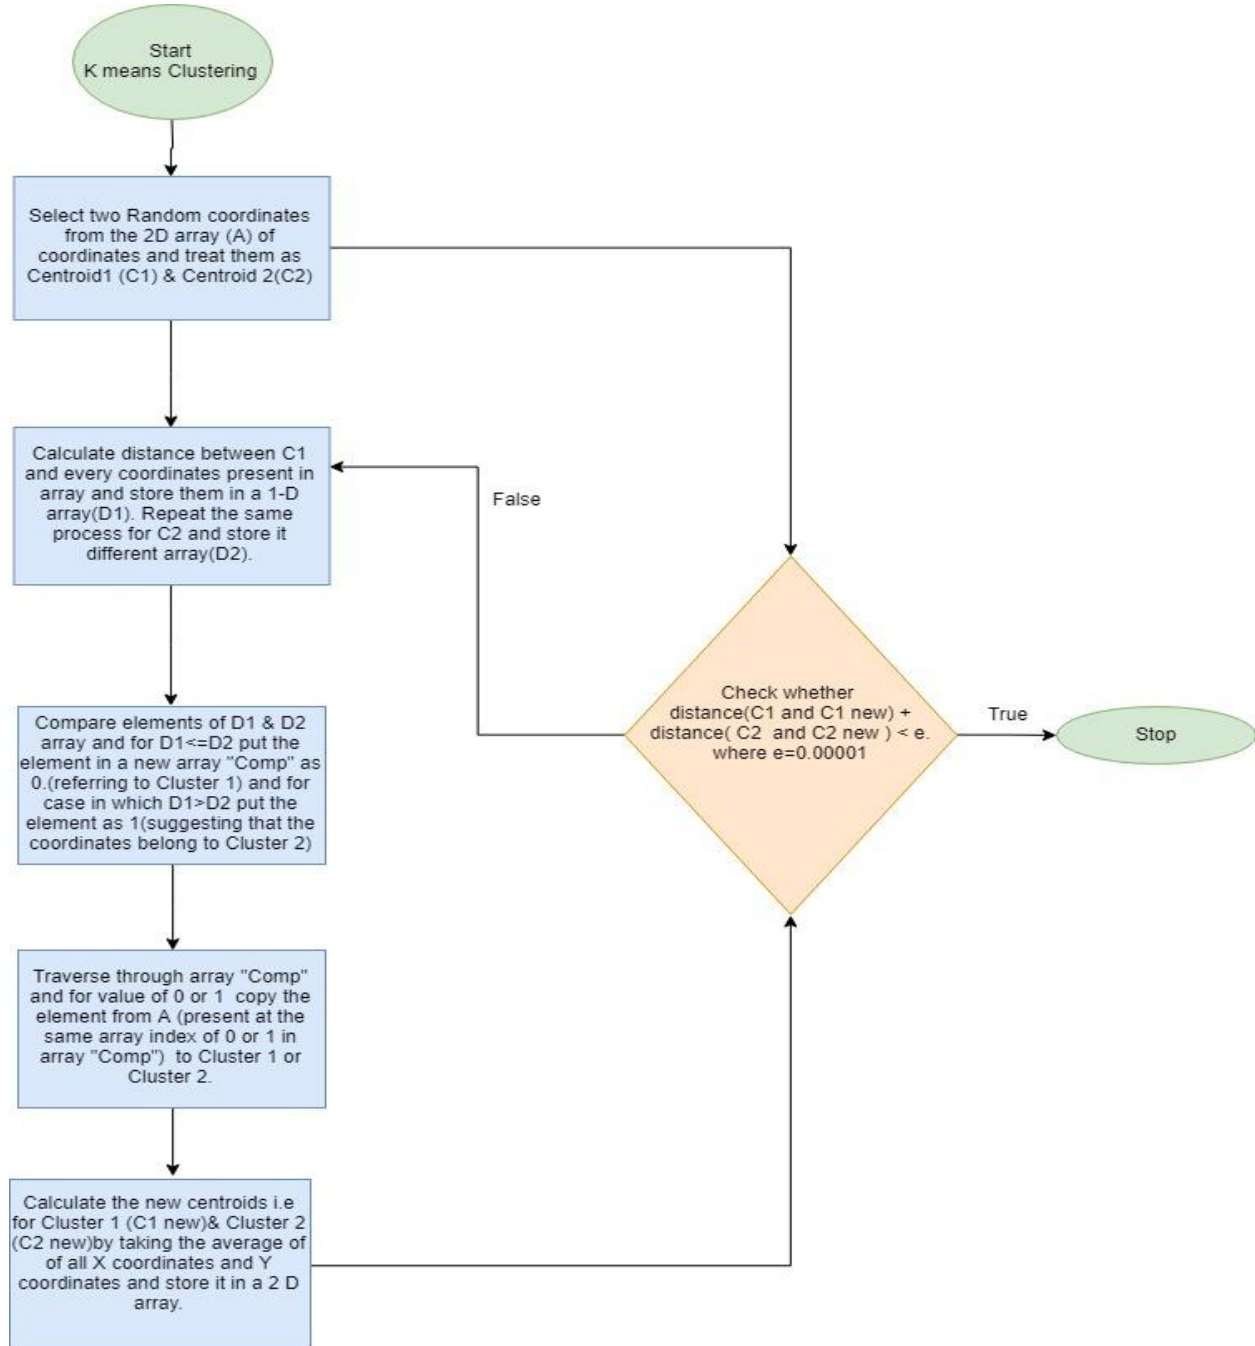

**Server Side: Receiving Data packets and Sending DACK**

## Client Side :Create REQ, Send REQ &amp; Receive RACK

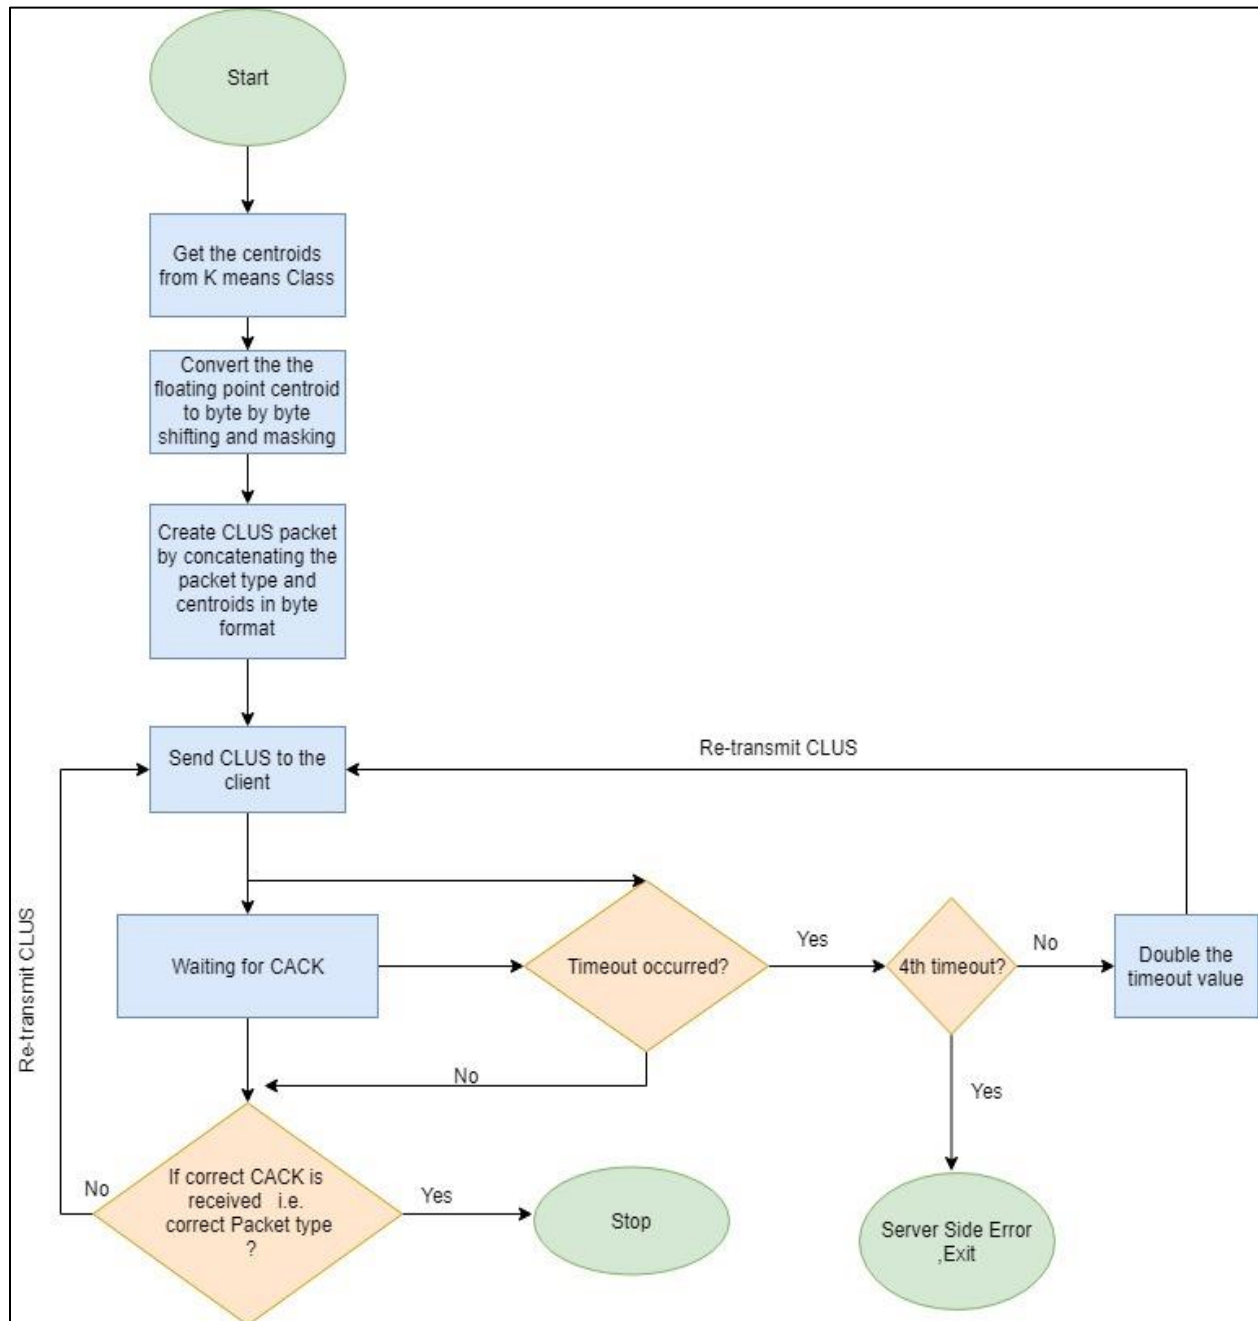

**Server Side: Receiver REQ & Send RACK**

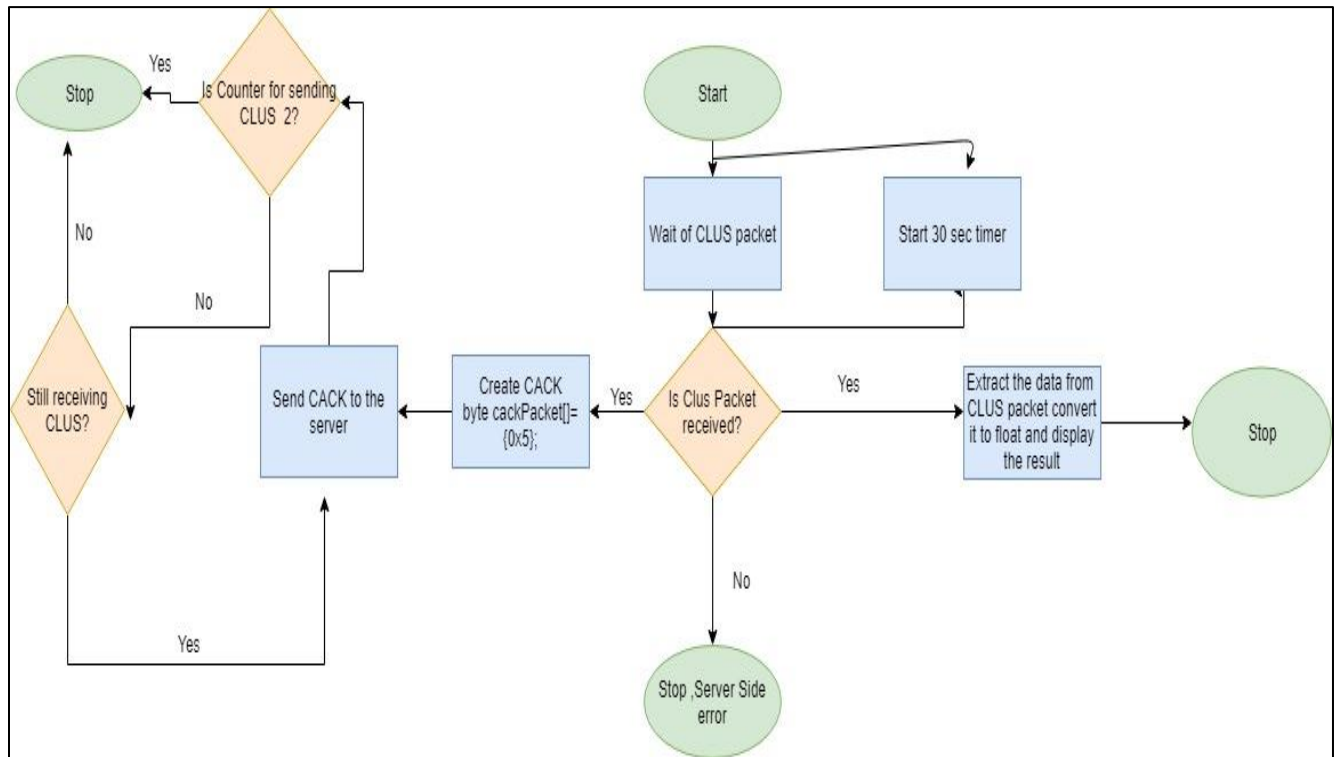

**K means Clustering**

K-means Clustering java program flow graph

## Server Side: Create CLUS, Send CLUS &amp; Receive CACK

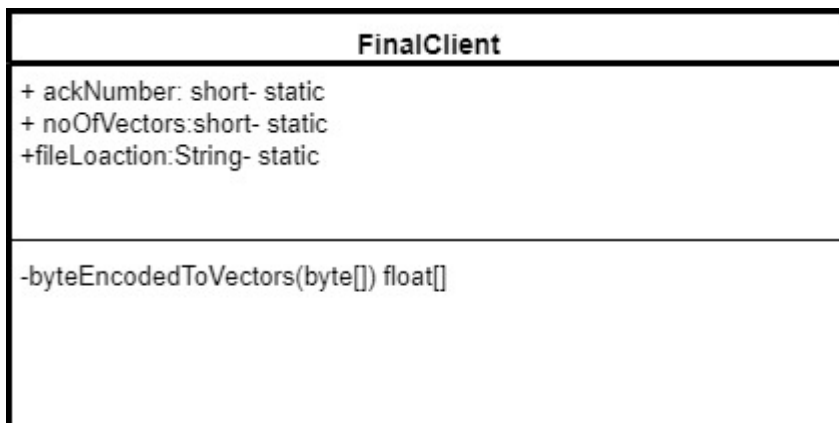

**Client Side: Receive CLUS & Send CACK**

After drawing all the above flow diagram, we started with the coding in Java using eclipse. We divided our overall code in four classes namely:

- FinalClient: Communicates with server.
- FinalServer: Communicates with client and see if
- ReadTextEncodeByte: Reads the text file and convert the data into Byte format
- ComputeKmeans: Computes centroid and return its value.

**Below is the UML Diagram for above mentioned Classes**

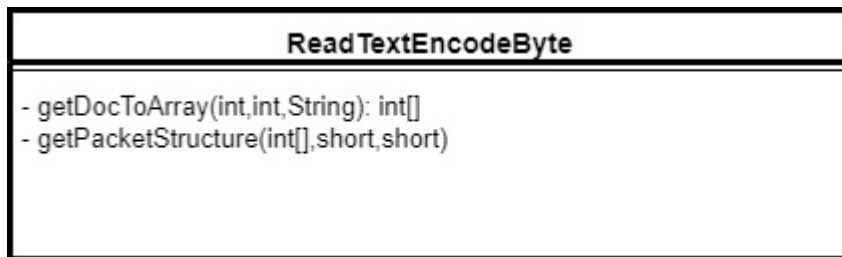

UML diagram from FinalClient

UML diagram for FinalServer

UML diagram for ReadTextEncodeByte

UML diagram for Class ComputeKmeans

### **Testing & Integration /Implementation**

During this phase we tested each code block one by one and debug whenever there was an error.

After the successful implementation of each code block we integrated them and tested the whole code. Below is the output for every possible timeouts and incorrect packet/data received.

**SERVER NOT RUNNING:**

```

Console Problems Debug Shell
<terminated> FinalClient [Java Application] C:\Program Files\Java\jre-10.0.2\bin\javaw.exe (05-Dec-2018, 10:49:37 AM)
Number of data vectors per DATA packet: 50
sending 0 DATA packet
Client DACK timeout!
sending 0 DATA packet
Client DACK timeout!
sending 0 DATA packet
Client DACK timeout!
Communication failure

```

**INCORRECT DATA RECEIVED:**

```

Console Problems Debug Shell
<terminated> FinalClient [Java Application] C:\Program Files\Java\jre-10.0.2\bin\javaw.exe (05-Dec-2018, 11:03:49 AM)
Number of data vectors per DATA packet: 50
sending 0 DATA packet
    DACK 0 received, correct
sending 1 DATA packet
    DACK 1 received, correct
sending 2 DATA packet
    DACK 2 received, correct
sending 3 DATA packet
    Inccrrct DACK received
Client DACK timeout!
sending 2 DATA packet
    Inccrrct DACK received
Client DACK timeout!
sending 2 DATA packet
    Inccrrct DACK received
Client DACK timeout!
Communication failure

```

```

Console Problems Debug Shell
FinalServer [Java Application] C:\Program Files\Java\jre-10.0.2\bin\javaw.exe (05-Dec-2018, 11:03:47 AM)
